

```
{  
  "_id" : <ObjectId>,  
  "name": "string",  
  "rating_values": [  
    List/array of ints  
  ],  
  "prep_time": "string",  
  "cook_time": "string",  
  "serves": string,  
  "ingredients": [  
    "List/array of strings"  
  ],  
  "instructions": [  
    "List/array of strings"  
  ],  
  "category": {  
    "type": "string",  
    "occasion": "string",  
    "cuisine": "string",  
    "main_ing": "string"  
  },  
  "author": "string",  
  "img": "string of relative filepath to image file",  
  "added_by": <ObjectId2> from the userLogin collection,  
  "added_date": "string",  
  "last_edited_date": "string",  
  "views": int,  
  "likes": int,  
  "deleted": bool  
}
```

***** The value for the “added_by” field will be populated when the user adds a recipe (this won’t be a field in the actual submission form, but the backend code will get the user ID when the form is submitted and push the value into this field – this value will then be displayed on the full recipe details page)**

***** The value for the “last_edited_date” field will be populated when the user edits a recipe (again, this won’t be a field in the actual submission form, but the backend code will get the when the recipe was edited and push the value into this field – this value will then be displayed on the full recipe details page)**
